### Introduction:

A hospital's surgery department is a very important department in the hospital as it is a specialized inpatient unit that handles surgical procedures and provides intensive medical care for patients. These departments perform a wide range of surgeries, including general surgery, laparoscopic surgery, bariatric surgery, vascular surgery, and oncological surgery.

# Flow of work:

Our website is designed to be used by the admins in the department, so that they can add a new patient to the database, add a new surgeon or a new admin, also they can add new devices that can work in the surgery department, and operations.

But the most important is that they can add appointments to the database, as the patient comes to make a specific surgery, we check if he doesn't exit in the database the admin must add him, then the admin makes an appointment for him with a certain surgeon, operation, and a room (note that this operation should be done in this room), the appointment also requires a date, which cannot overlap with the other appointments for the same patient, surgeon or room, as the patient might have an appointment already in the same date, the surgeon has a surgery for another patient in the same date, or the room will have an operation in that date and time, our appointment system also automatically checks the availability of the operation requirements (devices), so we check if these devices exist and active.

When the operation ends the admin can add it to the patient medical history, also it is automatically added to the surgeon operation history.

# Pages and Features:

#### Features:

- 1- You can navigate through the other pages using the navigation bar buttons.
- 2- log out in the exit button in the navigation bar.
- 3- See the admin profile using the profile button in the navigation bar.
- 4- See the number of (patients, surgeons, admins, operations, devices, and appointments) in the database.
- 5- Also, when you press on the plus button, it opens the add menu to add what you want (patient, surgeon, ... etc.).

Add admin overlay

When you press on the add button in the (admins section) it opens this overlayer where you can add an admin.

### Add patient overlay

The same is here for the patient but as you notice we don't need an email from the patient we just use his phone to contact him, also there is no password as he can't enter the system by anyway, we differentiate between two users by the national ID which is the primary key in the patients database.

#### Add surgeon overlay

For the surgeons we take an email, and phone for contacting, we also take his specialty, the primary key in the surgeon database is both the national Id and the email.

here we take a name for the device, the serial number for it as every device should has a specific serial number also, there is a product code for every device that defines the type of the device we noticed that from the clinical engineering course.

Add operation overlay

When adding an operation to the system we are interested in the price, duration, and the number of the room that can contain this operation, also we take a link of a

website where the we can describe this operation for more information about it, and the product code of the devices that this operation requires, notice that we take the product code not the serial number of the device as the we are looking for a type of devices not a specific device, (the operation code is generated automatically in the database).

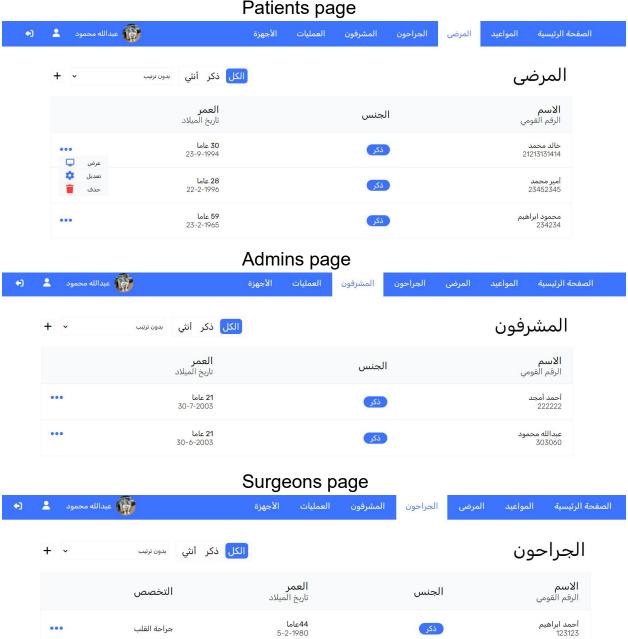

Add appointment overlay

When adding a new appointment, the admin should provide the national id of both the patient and the surgeon, also provide the operation code, the room he wants to book, and the date and time of the operation, the system automatically checks if the entered (national ids and operation code) exists in the database, then checks if the room entered matches the room that this operation should be made in, then checks if the devices required for this operation are available, then checks if the room, patient, and surgeon are empty in this period of time.

### Adding features:

- 1- If the admin enters any nonvalid value in any field the system tells him that he where is the error, for example that (the room you want to book for the appointment is not empty in that date and time).
- 2- When making an appointment the system automatically adds a preparation time for the room as every room should be cleaned and tested before every operation, (this preparation time is set to one hour).

In these pages we provide the (patients, admins, or surgeons) stored in our database with the essential information for every one of them.

#### Features:

- 1- In the top left corner, you can press the add button to add a new (patient, admin, or a surgeon) from this page.
- 2- For every (patient, admin, surgeon) you can press the settings button and then you can (show, edit, or delete) the selected data
- 3- For easier search you can specify the gender or sort the list of data by name or age either ascending or descending.
- 4- For more details of a specific (patient, surgeon, or admin) you can press the show button, and see his profile page.

Here we show all the devices with the ability to (edit, delete, and add) a device, also we enabled sorting the devices for easier search.

# Operations page

Here we show every operation in the hospital with similar features as previous pages.

As you can (edit, delete, or add) also search effectively.

	Appointments page

For the appointments we show the details from the appointments table, and some other details from other tables like the (patient, surgeon) names and the duration of the operation.

#### Features:

1- Editing and appointment enables adding emergency cases, as you can edit the date and time of the appointments overlapping with the emergency appointment,

and then add the emergency appointment also, you can get the phone of the edited appointment and agree for a new appointment.

# Admin profile

here we are just showing the personal data of the admin, also we enabled editing and deleting for his data.

# Patient profile page

here we show the patient's data, and we also show the medical history of the patient.

#### Features:

- 1- We allow adding a previous operation to the medical history.
- 2- Allowing editing or deleting the patient data

3- When editing the patient's data if the national id is changed somehow the system automatically changes it in the medical history database of this patient.

# Surgeon profile page

in the surgeon profile page we show his personal data, and the history of operations he made, (note that the history is the same database as the patient).

# Operation page

in the operation page we see the details of the operation, we can edit it or delete it, note that the used devices contain the product code of the devices used not the serial number, this enables the admin to take the product code and search on the FDA for the name of this group of devices.

# **Future Work:**

- 1- We can add a database for the rooms in the surgery department and make each for specific operations.
- 2- Also, we can make the specialty of the surgeon a factor in the appointment, which means the system automatically tells the admin that the surgeon he provided is not suitable for this operation.
- 3- Another improvement is that we can make the website responsive, and suitable for all devices not just a laptop or a pc.
